New 24V lamps

Low voltage lighting for electrical panels

Safe and efficient lighting

The development of technology involves adequate progress in the safety regulations and ergonomic aspects of machines and appliances. To intervene in the maintenance or setting stages, it is essential to have powerful lighting, distributed evenly and without stroboscopic effects; failure to observe these requirements, in fact, could generate hazardous situations for operators caused by areas of shadow, glares or poor and fluctuating lighting. Based on these principles New Elfin has devised the new, **low voltage, electronic ceiling lamp** to light electrical panels.

The **24 V** power supply increases considerably the safety for those who work on electrical panels guaranteeing an elevated efficiency.
