## New “Omega” rail in PVC

The new “Omega” rail in PVC offers an undisputed series of advantages in assembling electric panels, control panels and electromechanical installations. The specific features of the PVC make it ideal for use in environments with corrosive atmospheres (chemical, pharmaceutical and food industries) or in external areas where a high level of humidity can lead to rust formation over time. The lightweight, ease in cutting/drilling, the total electrical insulation and efficiency are the strong points that make the new PVC rails a product able to satisfy the reliability demanded by the market.
